STRATEGY

As consumer awareness of microplastic risks grows and regulatory pressures increase, food companies, retailers, and manufacturers face mounting challenges in transitioning away from traditional plastic packaging. Our website aims to serve as a business-to-business hub that connects these organizations with suppliers of sustainable, plastic-free packaging solutions. Rather than focusing on consumer education alone, the site will function as a practical tool for businesses seeking to reduce their plastic footprint while staying competitive and compliant with evolving regulations. It will highlight how adopting eco-friendly packaging can improve both brand reputation and long-term sustainability.

Through this platform, we will:

1. Serve as a centralized marketplace for businesses, retailers, and manufacturers to discover and connect with verified suppliers of biodegradable, reusable, and plastic-free packaging.
2. Provide resources and tools to help businesses assess their plastic footprint, evaluate sustainable alternatives, and navigate regulatory requirements.
3. Showcase case studies and best practices from industry leaders who have successfully transitioned to eco-friendly packaging, demonstrating tangible business benefits.
4. Facilitate partnerships and collaboration between buyers and suppliers committed to sustainable practices, fostering a community dedicated to reducing plastic waste.

With an intuitive and user-friendly interface, the platform will enable businesses to efficiently find packaging solutions that align with their sustainability goals and operational needs. By consolidating supplier information, regulatory updates, and practical guidance in one accessible location, we aim to accelerate the industry-wide shift toward plastic-free packaging ultimately protecting consumer health, enhancing brand trust, and supporting a more sustainable future.

SCOPE

The website consists of the following key pages and features:

1. Home Page

This page serves as the main entry point, introducing the purpose of the platform and providing an overview of services.

2. Suppliers Page

This page will function as a searchable directory of verified, certified sustainable packaging suppliers.

3. Products Page

This page will showcase available sustainable packaging products.

4. Knowledge Hub

A resource center for businesses transitioning to sustainable packaging.

5. Reviews Page

A community-driven section where businesses can share feedback and ratings on suppliers and products.

6. Contact Us Page

A dedicated page for inquiries, support requests, and partnership opportunities.

IMPLEMENTATION

Our three-person team built the EarthArmor Packaging website from scratch using HTML, CSS, and JavaScript. This approach allowed us to demonstrate core web development skills while retaining full creative and functional control.

HTML Structure & Site Organization

We began by outlining a clear, semantic HTML5 structure for each page (Home, Suppliers Directory, Products, Knowledge Hub and Contact us). A shared assets folder was organized to hold all underlying resources:

- css/ for stylesheets
- js/ for JavaScript files
- images/ for optimized logos, icons, and photos

Each team member took ownership of one primary page, ensuring consistency through a shared styles.css base and reusable components (navigation, footer, buttons).

CSS Implementation

We established a design system, including a core color palette anchored by #2ecc71 (green for sustainability) and consistent typography which was documented in a shared Google Drive. Media queries were employed to adapt layouts across device sizes.

JavaScript Component & Functionality

The “JavaScript” component of the site is focused on enhancing interactivity without reliance on external libraries. Key features include:

1. Suppliers Directory Filtering – Interactive filtering by material, location, and certification, dynamically updating displayed suppliers.
2. Form Validation – Client-side validation for contact and inquiry forms.
3. Live Chat Widget – A simulated chat interface on the Home Page for user engagement.
4. Content Toggles – Expandable/collapsible sections in the Knowledge Hub for better content organization.

Collaboration & Integration

We used Google Drive for version control of assets and design guidelines. After developing pages independently, we integrated them into a single folder structure, checking all internal links and responsive behavior. Regular check-ins ensured consistent implementation of navigation, footers, and interactive states. Final validation included HTML/CSS validation, performance testing, and cross-browser checks.

REFLECTION

Future Directions

We plan to build a secure backend with MySQL to enable user accounts and data tracking. Securing a professional domain and reliable hosting will ensure platform credibility and access. Marketing efforts will target food businesses and suppliers through industry networks. Future features may include dashboards, e-commerce integration, and AI-based matching. Multilingual support and compliance alerts will help the platform serve global markets. Continuous user feedback will guide iterative improvements and new functionality.

Lessons Learned

Building with pure HTML, CSS, and JavaScript strengthened our foundational coding skills. Early collaboration on design standards was key to visual consistency across pages. Using GitHub from the start would have streamlined version control and teamwork. JavaScript brought essential interactivity to filters, chat, and form validation. Designing for businesses required prioritizing clarity and usability over decorative flair. Regular meetings and peer reviews ensured seamless integration of all components. The project highlighted how technology can advance both business and sustainability goals.
